PHISHING AWARENESS TRAINING

Think Before You Click

What is Phishing ?

01

Phishing is a form of online deception

Attackers send fake emails, messages, or websites that look legitimate, to trick you into revealing personal or financial information.

02

It relies on human trust, not technical flaws

Scammers exploit trust and emotions to make you click links or open attachments without thinking twice.

03

It's the gateway to bigger attacks

Once you click a phishing link, attackers can steal data or money, install malware, or access systems, often the first step in bigger cyberattacks.

HOW PHISHING WORKS ?

The Bait

A fake email, text, or message arrives, often disguised as something familiar, your bank, HR department, or a delivery service.

The Hook

The message creates a sense of urgency or fear, urging you to click a link, open an attachment, or provide personal details.

The Catch

Once you act, attackers steal sensitive data, install malware, or gain unauthorized access to systems.

TYPES OF PHISHING ATTACKS

Email Phishing

Fake emails that impersonate trusted senders (banks, IT, vendors) to steal credentials or deliver malware.

Smishing & Vishing

Attacks via text messages or phone calls that pressure you to click links or disclose info. Attackers impersonate couriers, banks, or tech support.

Website Spoofing

Scammers clone legitimate websites or use look-alike domains to capture login details and payment info.

SPOT A PHISHING EMAIL

Check the Sender

Look closely at the email address — scammers often use similar-looking names or domains (e.g., support@paypall.com). If it seems off, it probably is.

Inspect Links

Hover over links before clicking — fake URLs often look close to real ones.
Avoid downloading attachments from unknown senders.

Look for Grammar

Poor grammar, unusual phrasing, or generic greetings (“Dear User”) are strong phishing clues.
Legit companies rarely send unpolished messages.

Watch for Urgent

Phrases like “Your account will be locked” or “Act now” try to create panic.
Pause and verify before responding.

DETECT WEB SPOOFING

01

Check the URL Carefully

Look for misspellings, extra words, or strange domains (like amaz0n-login.com instead of amazon.in).
Always type the address manually or use saved bookmarks.

02

Verify Security & Design

A genuine site uses HTTPS and a padlock symbol — but don't rely on that alone.
Watch for low-quality logos, odd layouts, or missing contact info

03

Look for Mismatched Links or Pop-ups

Hover over links — if the URL preview doesn't match the text, it's a red flag.
Be cautious of login pop-ups asking for personal or banking details.

SOCIAL - ENGINEERING TRICKS

Fear & Urgency

They want you to click before thinking.

Always pause and verify before taking action.

Greed

If it sounds too good to be true, it probably is.

Never share personal details to “claim” something.

Curiosity

Curiosity clicks lead to malware or stolen data.

Stay alert — don’t take the bait.

HOW TO PROTECT YOURSELF?

01

Think Before You Click

Pause before clicking links or attachments. Check URLs and sender details for anything unusual.

02

Secure Your Accounts

Use strong, unique passwords and enable MFA. It helps block hackers even if your password is stolen

03

Report and Stay Alert

Report suspicious messages to IT right away. Keep learning and stay updated on cybersecurity.

HOW TO REPORT PHISHING ATTACK ?

Report Online

Go to
www.cybercrime.gov.in
Submit details under
online or financial frauds.
Attach screenshots or
email evidence.

Inform Your Bank

Contact your bank's fraud
helpline or branch
immediately.
Request to block
transactions and secure
your account.

Alert Your IT Team

Forward the phishing
message to your
IT/security department.
Helps protect your
organization and
coworkers.

QUIZ TIME!

Phishing Awareness – True or False Quiz

Phishing only happens through email.

 False – It can also happen via SMS, calls, or social media.

Urgent or threatening messages are a common phishing sign.

 True – Scammers create panic to make you act fast.

If a website has HTTPS, it's always safe.

 False – Hackers can also use HTTPS to look legitimate.

Real organizations never ask for passwords or OTPs via email or text.

 True – They use secure channels for sensitive info.

It's safe to download attachments from unknown senders.

 False – They might contain malware.

STAY SAFE. STAY SMART. STOP PHISH.

Key Takeaways:

- Think before you click — pause and verify suspicious messages.
- Protect your accounts — use strong passwords & enable MFA.
- Report quickly — help stop phishing across your organization.

Remember:

Cybersecurity starts with you.
A single click can open the door — or keep it locked.
